## Definition

The solutions or roots of the quadratic equation $a x^{2}+b x+c=0$ are given by

$$
x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}
$$

1. $|a b|=|a||b|$
2. $\left|\frac{a}{b}\right|=\frac{|a|}{|b|}$
3. $|a+b| \leq|a|+|b|$
4. $|a-b| \geq||a|-|b||$

The equation of a circle centered at $(h, k)$ with radius $r$ is:

$$
(x-h)^{2}+(y-k)^{2}=r^{2}
$$

$$
\begin{aligned}
& \sec \theta=\frac{1}{\cos \theta} \quad \csc \theta=\frac{1}{\sin \theta} \\
& \tan \theta=\frac{\sin \theta}{\cos \theta} \quad \cot \theta=\frac{\cos \theta}{\sin \theta}
\end{aligned}
$$

A function is a mapping that associates with each object $x$ in one set, which we call the domain, a single value $f(x)$ from a second set which we call the range.

two special trigonometric limits

Theorem
Definition
point-wise continuity
composition limit theorem

If a function $f(x)$ is defined on an open interval containing $c$, except possibly at $c$, then the
limit of $f(x)$ as $x$ approaches $c$ equals $L$ is denoted

$$
\lim _{x \rightarrow c} f(x)=L
$$

The above equality holds if and only if for any $\varepsilon>0$ there exists a $\delta>0$ such that

$$
0<|x-c|<\delta \Rightarrow|f(x)-L|<\varepsilon
$$

$$
\lim _{x \rightarrow c} f(x)=L \Leftrightarrow \lim _{x \rightarrow c^{+}} f(x)=\lim _{x \rightarrow c^{-}} f(x)=L
$$

Let $f, g$ be functions that have limits at $c$, and let $n$ be a positive integer.
7. $\lim _{x \rightarrow c} \frac{f(x)}{g(x)}=\frac{\lim _{x \rightarrow c} f(x)}{\lim _{x \rightarrow c} g(x)}$ if $\lim _{x \rightarrow c} g(x) \neq 0$
8. $\lim _{x \rightarrow c}[f(x)]^{n}=\left[\lim _{x \rightarrow c} f(x)\right]^{n}$
9. $\lim _{x \rightarrow c} \sqrt[n]{f(x)}=\sqrt[n]{\lim _{x \rightarrow c} f(x)}$ provided that $\lim _{x \rightarrow c} f(x)>0$ when $n$ is even.

$$
\begin{gathered}
\lim _{x \rightarrow 0} \frac{\sin x}{x}=1 \\
\lim _{x \rightarrow 0} \frac{1-\cos x}{x}=0
\end{gathered}
$$

If $\lim _{x \rightarrow c} g(x)=L$ and $f$ is continuous at $L$, then

$$
\lim _{x \rightarrow c} f(g(x))=f\left(\lim _{x \rightarrow c} g(x)\right)=f(L)
$$

even $\quad f(-x)=f(x)$ for all $x \quad$ e.g. $x^{2}, \cos (x)$
odd $\quad f(-x)=-f(x) \quad$ for all $x \quad$ e.g. $x, \sin (x)$

## right-handed limit

$$
\lim _{x \rightarrow c^{+}} f(x)=L
$$

iff for any $\varepsilon>0$ there exists a $\delta$ such that

$$
0<x-c<\delta \Rightarrow|f(x)-L|<\varepsilon
$$

Let $k$ be a constant, and $f, g$ be functions that have limits at $c$.

1. $\lim _{x \rightarrow c} k=k$
2. $\lim _{x \rightarrow c} x=c$
3. $\lim _{x \rightarrow c} k f(x)=k \lim _{x \rightarrow c} f(x)$
4. $\lim _{x \rightarrow c}[f(x)+g(x)]=\lim _{x \rightarrow c} f(x)+\lim _{x \rightarrow c} g(x)$
5. $\lim _{x \rightarrow c}[f(x)-g(x)]=\lim _{x \rightarrow c} f(x)-\lim _{x \rightarrow c} g(x)$
6. $\lim _{x \rightarrow c}[f(x) \cdot g(x)]=\lim _{x \rightarrow c} f(x) \cdot \lim _{x \rightarrow c} g(x)$

Suppose $f, g$ and $h$ are functions which satisfy the inequality $f(x) \leq g(x) \leq h(x)$ for all $x$ near $c$, (except possibly at $c$ ). Then

$$
\lim _{x \rightarrow c} f(x)=\lim _{x \rightarrow c} h(x)=L \Rightarrow \lim _{x \rightarrow c} g(x)=L
$$

Let $f$ be defined on an open interval containing $c$, then we say that f is point-wise continuous at $c$ if

$$
\lim _{x \rightarrow c} f(x)=f(c)
$$

Calculus I

Theorem
generalized power rule
Definition
notation for higher-order derivatives

The derivative of a function $f$ is another function $f^{\prime}$ (read "f prime") whose value at $x$ is

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}
$$

provided the limit exists and is not $\infty$ or $-\infty$.

If the function $f$ is differentiable at $c$, then $f$ is continuous at $c$.

Let $f$ and $g$ be functions of $x$ and $k$ a constant.

1. scalar product rule $(k f)^{\prime}=k f^{\prime}$
2. sum rule $(f+g)^{\prime}=f^{\prime}+g^{\prime}$
3. difference rule $(f-g)^{\prime}=f^{\prime}-g^{\prime}$
4. product rule $(f g)^{\prime}=f^{\prime} g+f g^{\prime}$
5. quotient rule $\left(\frac{f}{g}\right)^{\prime}=\frac{f^{\prime} g-g^{\prime} f}{g^{2}}$

Let $u=g(x)$ and $y=f(u)$. If $g$ is differentiable at $x$, and $f$ is differentiable at $u=g(x)$, then the composite function $(f \circ g)(x)=f(g(x))$ is differentiable at $x$ and

$$
(f \circ g)^{\prime}(x)=f^{\prime}(g(x)) g^{\prime}(x)
$$

In Leibniz notation

$$
\frac{d y}{d x}=\frac{d y}{d u} \frac{d u}{d x}
$$

| Derivative | $f^{\prime}(x)$ | $y^{\prime}$ | $D$ | Leibniz |
| :---: | :---: | :---: | :---: | :---: |
| first | $f^{\prime}(x)$ | $y^{\prime}$ | $D_{x} y$ | $\frac{d y}{d x}$ |
| second | $f^{\prime \prime}(x)$ | $y^{\prime \prime}$ | $D_{x}^{2} y$ | $\frac{d^{2} y}{d x^{2}}$ |
| third | $f^{\prime \prime \prime}(x)$ | $y^{\prime \prime \prime}$ | $D_{x}^{3} y$ | $\frac{d^{3} y}{d x^{3}}$ |
| fourth | $f^{(4)}(x)$ | $y^{(4)}$ | $D_{x}^{4} y$ | $\frac{d^{4} y}{d x^{4}}$ |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| nth | $f^{(n)}(x)$ | $y^{(n)}$ | $D_{x}^{n} y$ | $\frac{d^{n} y}{d x^{n}}$ |

A function $f$ is said to be continuous on an open inteval iff $f$ is continuous at every point of the open interval.
A function $f$ is said to be continuous on a closed interval $[a, b]$ iff

1. $f$ is continuous on $(a, b)$ and
2. $\lim _{x \rightarrow a^{+}} f(x)=f(a)$ and
3. $\lim _{x \rightarrow b^{-}} f(x)=f(b)$

$$
f^{\prime}(c)=\lim _{x \rightarrow c} \frac{f(x)-f(c)}{x-c}
$$

$$
\begin{array}{ll}
f(x)=k & f^{\prime}(x)=0 \\
f(x)=x & f^{\prime}(x)=1 \\
f(x)=x^{n} & f^{\prime}(x)=n x^{n-1}
\end{array}
$$

$$
\begin{aligned}
(\sin x)^{\prime} & =\cos x \\
(\cos x)^{\prime} & =-\sin x \\
(\tan x)^{\prime} & =\sec ^{2} x \\
(\cot x)^{\prime} & =-\csc ^{2} x \\
(\sec x)^{\prime} & =\sec x \tan x \\
(\csc x)^{\prime} & =-\csc x \cot x
\end{aligned}
$$

If $f$ is a differentiable function and $n$ is an integer, then the power of the function

$$
y=[f(x)]^{n}
$$

is differentiable and

$$
\frac{d y}{d x}=n[f(x)]^{n-1} f^{\prime}(x)
$$

first derivative test

If the function $f$ is continuous on the closed interval $[a, b]$ and $v$ is any value between the minimum and maximum of $f$ on $[a, b]$, then $f$ takes on the value $v$.

A function $f$ defined on the interval $I$ is

- increasing on $I \Leftrightarrow$ for every $x_{1}, x_{2} \in I$

$$
x_{1}<x_{2} \Rightarrow f\left(x_{1}\right)<f\left(x_{2}\right)
$$

- decreasing on $I \Leftrightarrow$ for every $x_{1}, x_{2} \in I$

$$
x_{1}<x_{2} \Rightarrow f\left(x_{1}\right)>f\left(x_{2}\right)
$$

The function $f$ is said to be monotonic on $I$ if $f$ is either increasing or decreasing on $I$.

Suppose $f$ is differentiable on an open interval $I$, then if $f^{\prime}$ is increasing on $I$ we say that $f$ is concave up on $I$.

If $f^{\prime}$ is decreasing on $I$ we say that $f$ is concave down on $I$.

Let $f$ be continuous at $c$, then the ordered pair $(c, f(c))$ is called an inflection point of $f$ if $f$ is concave up on one side of $c$ and concave down on the other side of $c$.

Let $f$ be differentiable on an open interval $(a, b)$ that contains $c$.

1. $f^{\prime}(x)>0 \forall x \in(a, c)$ and $f^{\prime}(x)<0 \forall x \in$ $(c, b) \Rightarrow f(c)$ is a local maximum of $f$.
2. $f^{\prime}(x)<0 \forall x \in(a, c)$ and $f^{\prime}(x)>0 \forall x \in$ $(c, b) \Rightarrow f(c)$ is a local minimum of $f$.
3. If $f^{\prime}(x)$ has the same sign on both sides of c , then $f(c)$ is not a local extremum.

If the function $f$ is continuous on the closed interval $[a, b]$, then $f$ has a maximum value and a minimum value on the interval $[a, b]$.

If $f$ is a function defined on an open interval containing the point $c$, we call $c$ a critical point of $f$ iff either

- $f^{\prime}(c)=0$ or
- $f^{\prime}(c)$ does not exist

Furthermore when $f^{\prime}(c)=0$ we call $c$ a stationary point of $f$, and when $f^{\prime}(c)$ does not exist we call $c$ a singular point of $f$.

Suppose $f$ is differentiable on an open interval $I$, then

- $f^{\prime}(x)>0$ for each $x \in I \Rightarrow f$ is increasing on $I$
- $f^{\prime}(x)<0$ for each $x \in I \Rightarrow f$ is decreasing on $I$

Let $f$ be twice differentiable on the open interval $I$.

- $f^{\prime \prime}(x)>0$ for each $x \in I \Rightarrow$ $f$ is concave up on $I$
- $f^{\prime \prime}(x)<0$ for each $x \in I \Rightarrow$ $f$ is concave down on $I$

Let the function $f$ be defined on an interval $I$ containing $c$. We say $f$ has a local maximum at $c$ iff there exists an interval $(a, b)$ containing $c$ such that $f(x) \leq f(c)$ for all $x \in(a, b)$.

We say $f$ has a local minimum at $c$ iff there exists an interval $(a, b)$ containing $c$ such that $f(x) \geq f(c)$ for all $x \in(a, b)$.

A local extremum is either a local maximum or a local minimum.

Calculus I

If $f$ is continuous on a closed interval $[a, b]$ and differentiable on its interior $(a, b)$, then there is at least one point $c$ in $(a, b)$ such that

$$
\frac{f(b)-f(a)}{b-a}=f^{\prime}(c)
$$

or equivalently

$$
f(b)-f(a)=f^{\prime}(c)(b-a)
$$

Let $f$ be twice differentiable on an open interval containing $c$, and suppose $f^{\prime}(c)=0$.

1. If $f^{\prime \prime}(c)<0$, then $f$ has a local maximum at c.
2. If $f^{\prime \prime}(c)>0$, then $f$ has a local minimum at $c$.
3. If $f^{\prime \prime}(c)=0$, then the test fails.
