

## Examples: Solving $n$ th Order Equations

- Atoms
- L. Euler's Theorem
- The Atom List
- First Order. Solve  $2y' + 5y = 0$ .
- Second Order.  
Solve  $y'' + 2y' + y = 0$ ,  $y'' + 3y' + 2y = 0$  and  $y'' + 2y' + 5y = 0$ .
- Third Order. Solve  $y''' - y' = 0$  and  $y''' - y'' = 0$ .
- Fourth Order. Solve  $y^{iv} - y'' = 0$ .

## Atoms

---

An **atom** is a term with coefficient **1** obtained by taking the real and imaginary parts of

$$x^j e^{ax} (\cos cx + i \sin cx), \quad j = 0, 1, 2, \dots,$$

where  $a$  and  $c$  represent real numbers and  $c \geq 0$ . By definition, zero is not an atom.

### Theorem 1 (L. Euler)

The function  $y = x^j e^{r_1 x}$  is a solution of a constant-coefficient linear homogeneous differential of the  $n$ th order if and only if  $(r - r_1)^{j+1}$  divides the characteristic polynomial.

---

Euler's theorem is used to construct solutions of the  $n$ th order differential equation. The solutions so constructed are  $n$  distinct atoms, hence independent. Picard's theorem implies the list of atoms is a basis for the solution space.

## The Atom List

---

1. If  $r_1$  is a real root, then the atom list for  $r_1$  begins with  $e^{r_1 x}$ . The revised atom list is

$$e^{r_1 x}, x e^{r_1 x}, \dots, x^{k-1} e^{r_1 x}$$

provided  $r_1$  is a root of multiplicity  $k$ . This means that factor  $(r - r_1)^k$  divides the characteristic polynomial, but factor  $(r - r_1)^{k+1}$  does not.

2. If  $r_1 = \alpha + i\beta$ , with  $\beta > 0$  and its conjugate  $r_2 = \alpha - i\beta$  are roots of the characteristic equation, then the atom list for this pair of roots (both  $r_1$  and  $r_2$  counted) begins with

$$e^{\alpha x} \cos \beta x, \quad e^{\alpha x} \sin \beta x.$$

For a root of multiplicity  $k$ , these real atoms are multiplied by atoms  $1, \dots, x^{k-1}$  to obtain a list of  $2k$  atoms

$$\begin{aligned} &e^{\alpha x} \cos \beta x, \quad x e^{\alpha x} \cos \beta x, \quad \dots, \quad x^{k-1} e^{\alpha x} \cos \beta x, \\ &e^{\alpha x} \sin \beta x, \quad x e^{\alpha x} \sin \beta x, \quad \dots, \quad x^{k-1} e^{\alpha x} \sin \beta x. \end{aligned}$$

**1 Example (First Order)** Solve  $2y' + 5y = 0$  by Euler's method, verifying  $y_h = c_1 e^{-5x/2}$ .

### Solution

$2y' + 5y = 0$       Given differential equation.

$2r + 5 = 0$       Characteristic equation. Find it by replacement  $y^{(n)} \rightarrow r^n$ .

$r = -5/2$       Exactly one real root.

Atom =  $e^{-5x/2}$       For a real root  $r$ , the atom is  $e^{rx}$ .

$y_h = c_1 e^{-5x/2}$       The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, \dots$

**2 Example (Second Order I)** Solve  $y'' + 2y' + y = 0$  by Euler's method, showing  $y_h = c_1e^{-x} + c_2xe^{-x}$ .

**Solution**

$$y'' + 2y' + y = 0$$

$$r^2 + 2r + 1 = 0$$

$$r = -1, -1$$

$$\text{Atoms} = e^{-x}, xe^{-x}$$

$$y_h = c_1e^{-x} + c_2xe^{-x}$$

Given differential equation.

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

Exactly two real roots.

For a double root  $r$ , the atom list is  $e^{rx}, xe^{rx}$ .

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, \dots$

**3 Example (Second Order II)** Solve  $y'' + 3y' + 2y = 0$  by Euler's method, showing  $y_h = c_1e^{-x} + c_2e^{-2x}$ .

**Solution**

$$y'' + 3y' + 2y = 0$$

Given differential equation.

$$r^2 + 3r + 2 = 0$$

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

$$r = -1, -2$$

Factorization  $(r + 2)(r + 1) = 0$ .

$$\text{Atoms} = e^{-x}, e^{-2x}$$

For a real root  $r$  of multiplicity one, the atom is  $e^{rx}$ .

$$y_h = c_1e^{-x} + c_2e^{-2x}$$

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, \dots$

**4 Example (Second Order III)** Solve  $y'' + 2y' + 5y = 0$  by Euler's method, showing  $y_h = c_1 e^{-x} \cos 2x + c_2 x e^{-x} \sin 2x$ .

**Solution**

$$y'' + 2y' + 5y = 0$$

$$r^2 + 2r + 5 = 0$$

$$r = -1 + 2i, -1 - 2i$$

$$\text{Atoms} = e^{-x} \cos 2x, e^{-x} \sin 2x$$

$$y_h = c_1 e^{-x} \cos 2x + c_2 e^{-x} \sin 2x$$

Given differential equation.

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

$$\text{Factorization } (r + 1)^2 + 4 = 0.$$

For a complex root  $r = \alpha + i\beta$  of multiplicity one, the atoms are  $e^{\alpha x} \cos \beta x$  and  $e^{\alpha x} \sin \beta x$ .

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, \dots$

**5 Example (Third Order I)** Solve  $y''' - y' = 0$  by Euler's method, showing  $y_h = c_1 + c_2e^x + c_3e^{-x}$ .

**Solution**

$$y''' - y' = 0$$

$$r^3 - r = 0$$

$$r = 0, 1, -1$$

$$\text{Atoms} = 1, e^{-x}, e^x$$

$$y_h = c_1 + c_2e^{-x} + c_3e^x$$

Given differential equation.

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

Factorization  $r(r + 1)(r - 1) = 0$ .

For a real root  $r$  of multiplicity one, the atom is  $e^{rx}$ .

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, c_3, \dots$

**6 Example (Third Order II)** Solve  $y''' - y'' = 0$  by Euler's method, showing  $y_h = c_1 + c_2x + c_3e^x$ .

**Solution**

$$y''' - y'' = 0$$

$$r^3 - r^2 = 0$$

$$r = 0, 0, 1$$

$$\text{Atoms} = 1, x, e^x$$

$$y_h = c_1 + c_2x + c_3e^x$$

Given differential equation.

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

Factorization  $r^2(r - 1) = 0$ .

For a real root  $r$  of multiplicity one, the atom is  $e^{rx}$ .

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, c_3, \dots$

**7 Example (Fourth Order)** Solve  $y^{iv} - y'' = 0$  by Euler's method, showing  $y_h = c_1 + c_2x + c_3e^x + c_4e^{-x}$ .

**Solution**

$$y^{iv} - y'' = 0$$

$$r^4 - r^2 = 0$$

$$r = 0, 0, 1, -1$$

Atoms =  $1, x, e^x, e^{-x}$

$$y_h = c_1 + c_2x + c_3e^x + c_4e^{-x}$$

Given differential equation.

Characteristic equation. Use  $y^{(n)} \rightarrow r^n$ .

Factorization  $r^2(r - 1)(r + 1) = 0$ .

For a real root  $r$  of multiplicity one, the atom is  $e^{rx}$ . For a double root, the atoms are  $e^{rx}, xe^{rx}$ .

The general solution  $y_h$  is written by multiplying the atom list by constants  $c_1, c_2, c_3, c_4, \dots$
