# Quiz 6, Problem 1. Vertical Motion Seismoscope

The 1875 **horizontal motion seismoscope** of F. Cecchi (1822-1887) reacted to an earthquake. It started a clock, and then it started motion of a recording surface, which ran at a speed of 1 cm per second for 20 seconds. The clock provided the observer with the earthquake hit time.

#### A Simplistic Vertical Motion Seismoscope

The apparently stationary heavy mass on a spring writes with the attached stylus onto a rotating drum, as the ground moves up. The generated trace is x(t).

The motion of the heavy mass m in the figure can be modeled initially by a forced spring-mass system with damping. The initial model has the form

$$mx'' + cx' + kx = f(t)$$

where f(t) is the vertical ground force due to the earthquake. In terms of the vertical ground motion u(t), we write via Newton's second law the force equation f(t) = -mu''(t) (compare to falling body -mg). The final model for the motion of the mass is then

$$\begin{cases} x''(t) + 2\beta\Omega_0 x'(t) + \Omega_0^2 x(t) = -u''(t), \\ \frac{c}{m} = 2\beta\Omega_0, \quad \frac{k}{m} = \Omega_0^2, \\ x(t) = \text{center of mass position measured from equilibrium,} \\ u(t) = \text{vertical ground motion due to the earthquake.} \end{cases}$$

Terms **seismoscope**, **seismograph**, **seismometer** refer to the device in the figure. Some observations:

Slow ground movement means  $x'\approx 0$  and  $x''\approx 0$ , then (1) implies  $\Omega_0^2x(t)=-u''(t)$ . The seismometer records ground acceleration.

Fast ground movement means  $x\approx 0$  and  $x'\approx 0$ , then (1) implies x''(t)=-u''(t). The seismometer records ground displacement.

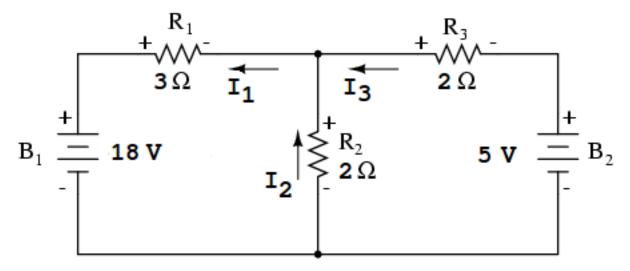

A release test begins by starting a vibration with u identically zero. Two successive maxima  $(t_1, x_1), (t_2, x_2)$  are recorded. This experiment determines constants  $\beta, \Omega_0$ .

The objective of (1) is to determine u(t), by knowing x(t) from the seismograph.

#### The Problem.

Assume the seismograph trace can be modeled at time t=0 (a time after the earthquake struck) by  $x(t)=10\cos(3t)$ . Assume a release test determined  $2\beta\Omega_0=16$  and  $\Omega_0^2=80$ . Explain how to find a formula for the ground motion u(t), then provide details for the answer  $u(t)=\frac{710}{9}\cos(3t)-\frac{160}{3}\sin(3t)$  (assume integration constants are zero).

Quiz6 Problem 2. Resistive Network with 2 Loops and DC Sources.

The Branch Current Method can be used to find a  $3\times3$  linear system for the branch currents  $I_1, I_2, I_3$ .

Symbol **KCL** means *Kirchhoff's Current Law*, which says the algebraic sum of the currents at a node is zero. Symbol **KVL** means *Kirchhoff's Voltage Law*, which says the algebraic sum of the voltage drops around a closed loop is zero.

- (a) Solve the equations to find the currents  $I_1, I_2, I_3$  in the figure.
- (b) Compute the voltage drops across resistors  $R_1, R_2, R_3$ . Answer:  $\frac{93}{8}, \frac{51}{8}, \frac{11}{8}$  volts.
- (c) Replace the 5 volt battery by a 4 volt battery. Solve the system again, and report the new currents and voltage drops.

## Quiz 6, Problem 3. RLC-Circuit

**The Problem.** Suppose  $E = \sin(40t)$ , L = 1 H,  $R = 50 \Omega$  and C = 0.01 F. The model for the charge Q(t) is  $LQ'' + RQ' + \frac{1}{C}Q = E(t)$ .

- (a) Differentiate the charge model and substitute  $I = \frac{dQ}{dt}$  to obtain the current model  $I'' + 50I' + 100I = 40\cos(40t)$ .
- (b) Find the **reactance**  $S = \omega L \frac{1}{\omega C}$ , where  $\omega = 40$  is the input frequency, the natural frequency of  $E = \sin(40t)$  and  $E' = 40\cos(40t)$ . Then find the **impedance**  $Z = \sqrt{S^2 + R^2}$ .
- (c) The steady-state current is  $I(t) = A\cos(40t) + B\sin(40t)$  for some constants A, B. Substitute  $I = A\cos(40t) + B\sin(40t)$  into the current model (a) and solve for A, B. Answers:  $A = -\frac{6}{625}$ ,  $B = \frac{8}{625}$ .
- (d) Write the answer in (c) in phase-amplitude form  $I = I_0 \sin(40t \delta)$  with  $I_0 > 0$  and  $\delta \ge 0$ . Then compute the **time lag**  $\delta/\omega$ .

Answers:  $I_0 = 0.016$ ,  $\delta = \arctan(0.75)$ ,  $\delta/\omega = 0.0160875$ .
