

## Chapter 8

Producing Data: Sampling

BPS - 5th Ed. Chapter 8 1

## Population and Sample

- ◆ Researchers often want to answer questions about some large group of individuals (this group is called the **population**)
- ◆ Often the researchers cannot measure (or survey) all individuals in the population, so they measure a subset of individuals that is chosen to represent the entire population (this subset is called a **sample**)
- ◆ The researchers then use *statistical techniques* to make conclusions about the population based on the sample

BPS - 5th Ed. Chapter 8 2

## Bad Sampling Designs

- ◆ Voluntary response sampling
  - allowing individuals to choose to be in the sample
- ◆ Convenience sampling
  - selecting individuals that are easiest to reach
- ❖ Both of these techniques are biased
  - systematically favor certain outcomes

BPS - 5th Ed. Chapter 8 3

## Voluntary Response

- ◆ To prepare for her book *Women and Love*, Shere Hite sent questionnaires to 100,000 women asking about love and relationships.
  - 4.5% responded
  - Hite used those responses to write her book
- ◆ Moore (*Statistics: Concepts and Controversies*, 1997) noted:
  - respondents “were fed up with men and eager to fight them...”
  - “the anger became the theme of the book...”
  - “but angry women are more likely” to respond

BPS - 5th Ed. Chapter 8 4

## Convenience Sampling

- ◆ Sampling mice from a large cage to study how a drug affects physical activity
  - lab assistant reaches into the cage to select the mice one at a time until 10 are chosen
- ◆ Which mice will likely be chosen?
  - could this sample yield biased results?

BPS - 5th Ed. Chapter 8 5

## Simple Random Sampling

- ◆ Each individual in the population has the same chance of being chosen for the sample
- ◆ Each group of individuals (in the population) of the required size ( $n$ ) has the same chance of being the sample actually selected
- ◆ Random selection:
  - “drawing names out of a hat”
  - table of random digits
  - computer software

BPS - 5th Ed. Chapter 8 6

### Table of Random Digits

- ◆ Table B on pg. 692 of text
  - each entry is equally likely to be any of the 10 digits 0 through 9
  - entries are *independent* of each other (knowledge of one entry gives no information about any other entries)
  - each pair of entries is equally likely to be any of the 100 pairs 00, 01, ..., 99
  - each triple of entries is equally likely to be any of the 1000 values 000, 001, ..., 999

BPS - 5th Ed. Chapter 8 7

### Choosing a Simple Random Sample (SRS)

STEP 1: Label each individual in the population

STEP 2: Use Table B to select labels at random

BPS - 5th Ed. Chapter 8 8

### Stratified Random Sample

- ◆ first divide the population into groups of similar individuals, called **strata**
- ◆ second, choose a separate SRS in each stratum
- ◆ third, combine these SRSs to form the full sample

BPS - 5th Ed. Chapter 8 9

### Stratified Random Sample Example

Suppose a university has the following student demographics:

Undergraduate	Graduate	First Professional	Special
55%	20%	5%	20%

A stratified random sample of 100 students could be chosen as follows: select a SRS of 55 undergraduates, a SRS of 20 graduates, a SRS of 5 first professional students, and a SRS of 20 special students; combine these 100 students.

BPS - 5th Ed. Chapter 8 10

### Cautions about Sample Surveys

- ◆ Undercoverage
  - some individuals or groups in the population are left out of the process of choosing the sample
- ◆ Nonresponse
  - individuals chosen for the sample cannot be contacted or refuse to cooperate/respond
- ◆ Response bias
  - behavior of respondent or interviewer may lead to inaccurate answers or measurements
- ◆ Wording of questions
  - confusing or leading (biased) questions; words with different meanings

BPS - 5th Ed. Chapter 8 11

### Nonresponse

- ◆ To prepare for her book *Women and Love*, Shere Hite sent questionnaires to 100,000 women asking about love and relationships.
  - **4.5% responded**
  - Hite used those responses to write her book
  - angry women are more likely to respond

BPS - 5th Ed. Chapter 8 12

## Response Bias

- ◆ A door-to-door survey is being conducted to determine drug use (past or present) of members of the community. Respondents may give *socially acceptable answers* (maybe not the truth!)
- ◆ For this survey on drug use, would it matter if a police officer is conducting the interview? (*bias from interviewer*)

BPS - 5th Ed.

Chapter 8

13

## Response Bias

### Asking the Uninformed

*Washington Post National Weekly Edition (April 10-16, 1995, p. 36)*

- ◆ A 1978 poll done in Cincinnati asked people whether they “favored or opposed repealing the 1975 Public Affairs Act.”
  - There was no such act!
  - About one third of those asked expressed an opinion about it.

BPS - 5th Ed.

Chapter 8

14

## Wording of Questions

A newsletter distributed by a politician to his constituents gave the results of a “nationwide survey on Americans’ attitudes about a variety of educational issues.” One of the questions asked was, “Should your legislature adopt a policy to assist children in failing schools to opt out of that school and attend an alternative school—public, private, or parochial—of the parents’ choosing?” From the wording of this question, can you speculate on what answer was desired? Explain.

BPS - 5th Ed.

Chapter 8

15

## Wording: Deliberate Bias

- ◆ “If you found a wallet with \$20 in it, would you return the money?”
- ◆ “If you found a wallet with \$20 in it, would you do the right thing and return the money?”

BPS - 5th Ed.

Chapter 8

16

## Wording: Unintentional Bias

- ◆ “I have taught several students over the past few years.”
  - How many students do you think I have taught?
  - How many years am I referring to?
- ◆ “Over the past few days, how many servings of fruit have you eaten?”
  - How many days are you considering?
  - What constitutes a serving?

BPS - 5th Ed.

Chapter 8

17

## Wording: Unnecessary Complexity

- ◆ “Do you sometimes find that you have arguments with your family members and co-workers?”
  - Arguments with family members
  - Arguments with co-workers

BPS - 5th Ed.

Chapter 8

18

## Inferences about the Population

- ◆ Values calculated from samples are used to make conclusions (*inferences*) about unknown values in the population
- ◆ Variability
  - different samples from the same population may yield different results for a particular value of interest
  - estimates from random samples will be closer to the true values in the population if the samples are larger
  - how close the estimates will likely be to the true values can be calculated -- this is called the margin of error
