Math 2250-1
Friday Oct 31

HW for Friday Nov. 7
- Maple project
- §5.5 49 50 52
- 5.6 3, 5, 7, 14, 16, 21, 22
- EP 3.7 (supplemental section) 2, 3, 4, 7, 11, 20

- Variation of parameters method of finding y_p, page 4 Wed notes) maybe won't on this

then begin §5.6: forced oscillations and resonance

Overview

$$m x'' + c x' + k x = F_0 \cos \omega t$$

- undamped $(c = 0)$

$$m x'' + k x = F_0 \cos \omega t$$

- $\omega \neq \omega_0 = \sqrt{\frac{k}{m}}$ $\quad x_p = A \cos \omega t + B \sin \omega t = C \cos(\omega t - \alpha)$

  general soltn $x = x_p + x_H = C \cos(\omega t - \alpha) + C_0 \cos(\omega_0 t - \alpha_0)$

- $\omega = \omega_0$ $\quad x_p = t(A \cos \omega_0 t + B \sin \omega_0 t) = t\, C \cos(\omega_0 t - \alpha)$ $\quad$ general soltn $x = x_p + x_H$

  RESONANCE!

- $\omega \neq \omega_0$, but ω close to ω_0
  BEATING

- damped $(c > 0)$ (More details Monday)

$$x_p = A \cos \omega t + B \sin \omega t = C \cos(\omega t - \alpha)$$

$x_H \rightarrow$ 3 possibilities (over, critically, underdamped)
key feature they all share is $x_H(t) \rightarrow 0$ exponentially fast as $t \rightarrow \infty$.

so x_p is called x_{sp} (steady periodic)
x_H is called x_{tr} (transient)

when damping c is small, and ω is near ω_0, then amplitude C of x_{sp} will (often) be a large multiple of forcing amplitude F_0. This is called approximate resonance

<u>Example 1</u> p350 : $m=1,\ k=9,\ F_0=80,\ \omega=5,\ \omega_0=?$

$$\begin{cases} x''(t) + 9x(t) = 80\cos 5t \\ x(0)=0 \\ x'(0)=0 \end{cases}$$

x_H:

x_p:

<u>ans</u>

$$x(t) = \underbrace{5\cos 3t}_{\substack{\uparrow \\ \text{period} \\ T_0=\frac{2\pi}{3}}} - \underbrace{5\cos 5t}_{\substack{\uparrow \\ \text{period} \\ T_1=\frac{2\pi}{5}}}$$

(and all integer multiples).

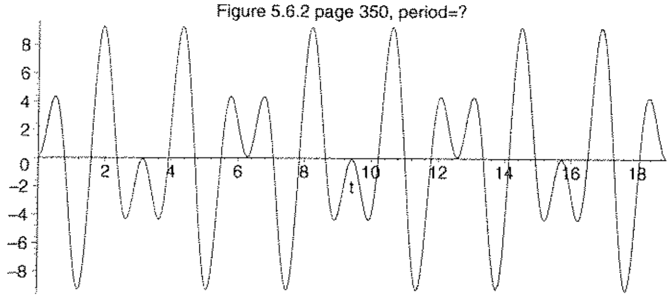
the period of the sum will be the least common integer multiple of T_0 and T_1, which in this case is

1b) $\boxed{}$

Example 1 page 350

```
> with(plots):
> plot(5*cos(3*t)-5*cos(5*t),t=0..6*Pi,color=black,
  title='Figure 5.6.2 page 350, period=?');
```

Figure 5.6.2 page 350, period=?



1c) for $x'' + \omega_0^2 x = \frac{F_0}{m}\cos\omega t$

$x(t) = x_p + x_H$.

When will the sum be periodic, when won't it be?

undamped forced IVP, $\omega \neq 0$, with letters

$$\begin{cases} x'' + \frac{k}{m} x = \frac{F_0}{m} \cos\omega t \\ x(0) = x_0 \\ x'(0) = v_0 \end{cases}$$

$$\begin{aligned}
+\tfrac{k}{m}\,(x_p &= A\cos\omega t) \\
+0\,(x_p' &= -A\omega \sin\omega t) \\
+1\,(x_p'' &= -A\omega^2 \cos\omega t) \\
\hline
L(x_p) &= \cos\omega t\, A \left[\underbrace{\tfrac{k}{m}}_{\omega_0^2} - \omega^2\right]
\end{aligned}$$

deduce $A(\omega_0^2 - \omega^2) = \frac{F_0}{m}$

$$A = \frac{F_0}{m}(\omega_0^2 - \omega^2)$$

so,

$x_p(t) = -\frac{F_0}{m}\frac{1}{(\omega^2-\omega_0^2)} \cos\omega t$. Note $x_H(t) = A\cos\omega_0 t + B\sin\omega_0 t$.

so, by plugging in or observation IVP solution is

$$\boxed{x(t) = \frac{+F_0}{m(\omega^2-\omega_0^2)}\left(\cos\omega_0 t - \cos\omega t\right) + x_0\cos\omega_0 t + \frac{v_0}{\omega_0}\sin\omega_0 t}$$

check IVP!

when ω is near (but $\neq 0$) ω_0, this sum varies between ± 2, depending on whether the two terms are in, or out of phase.... trig makes this precise!!

$$\cos(\alpha-\beta) - \cos(\alpha+\beta)$$

$$\cancel{\cos\alpha\cos\beta} + \sin\alpha\sin\beta - (\cancel{\cos\alpha\cos\beta} - \sin\alpha\sin\beta)$$

$$= 2\sin\alpha\sin\beta$$

Let $\alpha = \bar\omega t = \left(\frac{\omega+\omega_0}{2}\right)t$, $\beta = \delta t = \left(\frac{\omega-\omega_0}{2}\right)t$ } so $\alpha-\beta = \omega_0 t$, $\alpha+\beta = \omega t$

i.e.

$$\boxed{x(t) = \frac{F_0}{m(\omega^2-\omega_0^2)}\cdot 2\sin\bar\omega t\,\sin\delta t + x_0\cos\omega_0 t + \frac{v_0}{\omega_0}\sin\omega_0 t}$$

period $\frac{2\pi}{\bar\omega}$, $\bar\omega = \frac{\omega+\omega_0}{2}$

period $\frac{2\pi}{\delta}$ is huge if $\omega \approx \omega_0$: **Beating**

$\delta = \frac{\omega-\omega_0}{2}$

Notice the beating amplitude $\frac{2F_0}{m(\omega^2-\omega_0^2)}$ blows up as $\omega \to \omega_0$

Example 2 (not the text's).

Keep the same data as in # 1 : $m=1,\ k=9,\ F_0=80$

$\omega_0 = 3$

except choose $\omega = 3.1$

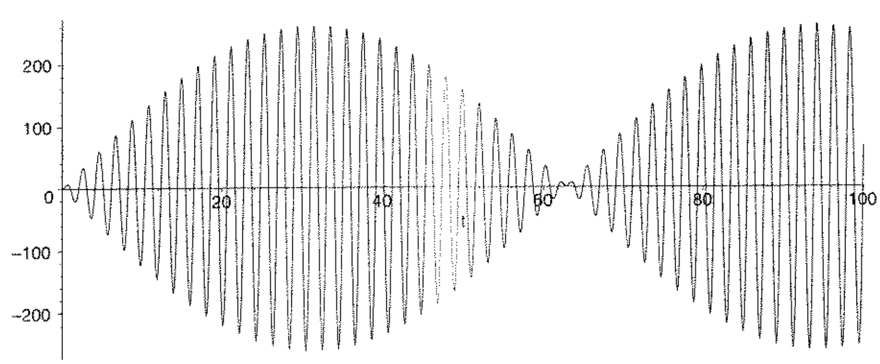
Use second box to solve IVP

$$\begin{cases} x'' + 9x = 80\cos(3.1t) \\ x(0) = 0 \\ v(0) = 0 \end{cases}$$

and compute the beating period and amplitude

ans $x(t) \cong 262.3 \sin(3.05t)\sin(.05t)$

$T_{beat} \approx 126$



Resonance! $\omega = \omega_0$

$$\begin{cases} x'' + \omega_0^2 x = \frac{F_0}{m}\cos\omega_0 t \\ x(0) = x_0 \\ x'(0) = v_0 \end{cases}$$

using § 5.5, guess

$$\begin{aligned}
+\omega_0^2 \Big(\quad & x_p = t\,(A\cos\omega_0 t + B\sin\omega_0 t) && \Big) \\
0 \Big(\quad & x_p' = t\,(-A\omega_0\sin\omega_0 t + B\omega_0\cos\omega_0 t) + A\cos\omega_0 t + B\sin\omega_0 t && \Big) \\
+1 \Big(\quad & x_p'' = t\,(-A\omega_0^2\cos\omega_0 t - B\omega_0^2\sin\omega_0 t) + \left[-A\omega_0\sin\omega_0 t + B\omega_0\cos\omega_0 t\right]2 && \Big)
\end{aligned}$$

$$L(x_p) = t(0) + 2\left[-A\omega_0\sin\omega_0 t + B\omega_0\cos\omega_0 t\right] \overset{\text{want}}{=} \frac{F_0}{m}\cos\omega_0 t$$

Deduce $A = 0$
$B = \frac{F_0}{2m\omega_0}$

$$x_p(t) = \underbrace{\frac{F_0}{2m\omega_0}\,t\sin\omega_0 t}_{\text{sats } x(0)=0,\ x'(0)=0}$$

, so IVP soln is

$$\boxed{x(t) = \frac{F_0}{2m\omega_0}\,t\sin\omega_0 t + x_0\cos\omega_0 t + \frac{x_0}{\omega_0}\sin\omega_0 t}$$

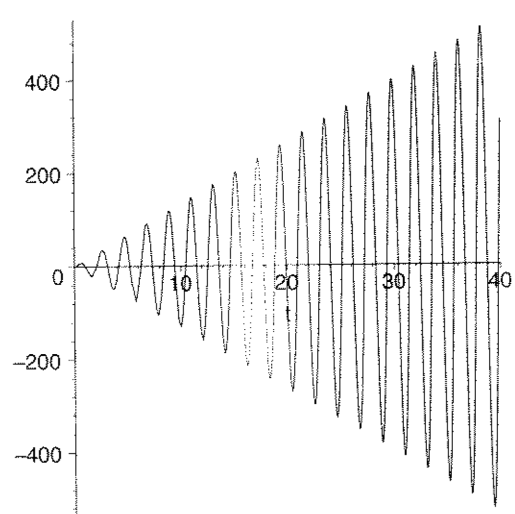
(you can also guess this by letting $\omega \to \omega_0$ on page 3, second box, via linearization!)

No matter how small $F_0 \neq 0$, soln blowup as $t \to \infty$!

<u>Example 3</u>, as before $m=1$, $k=9$ $(\omega_0 = 3)$
$F_0 = 80$
$\omega = 3$

$$\begin{cases} x'' + 9x = 80\cos 3t \\ x(0) = 0 \\ x'(0) = 0 \end{cases}$$

$x(t) = ?$



ans $x(t) = \frac{40}{3}\,t\sin 3t$
