①

Some preliminary uses of the Cauchy Integral formula: (f analytic in A , γ homotopic to a point in A)

$$f(z_0) I(\gamma; z_0) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(z)}{z - z_0} dz$$

$z_0 \notin \gamma(I)$

when $I(\gamma; z_0) \neq 0$ you
can recover $f(z_0)$ from the values of f along γ

1st application: diffble $\Rightarrow$ ∞ 'ly diffble, with estimates for derivs which only depend on f :
rewrite C.I.F.

$$f(z) I(\gamma; z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(\zeta)}{\zeta - z} d\zeta$$

$z \notin \gamma(I)$

Theorem: f analytic in $A \Rightarrow f$ ∞ 'ly diffble in A . In fact for γ homotopic to a point in A ,

$$f'(z) I(\gamma; z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(\zeta)}{(\zeta - z)^2} d\zeta$$

$$f^{(n)}(z) I(\gamma; z) = \frac{n!}{2\pi i} \int_{\gamma} \frac{f(\zeta)}{(\zeta - z)^{n+1}} d\zeta$$

notice, this is what we get by "differentiating thru the integral sign"

$$\frac{d}{dz} \frac{f(\zeta)}{\zeta - z} = f(\zeta) (-1) (\zeta - z)^{-2} (-1) = \frac{f(\zeta)}{(\zeta - z)^2}$$

$$\frac{d}{dz} \frac{f(\zeta)}{(\zeta - z)^n} = f(\zeta) (-n) (\zeta - z)^{-n-1} (-1) = \frac{n f(\zeta)}{(\zeta - z)^{n+1}}$$

So, when can you justify this operation?

That's an analysis question!!

analysis answer: (to justify the differentiation)

$$\text{Let } G(z) = \int_{\gamma} g(z, \zeta) d\zeta$$

$$\frac{G(z+h) - G(z)}{h} = \int_{\gamma} \frac{1}{h} (g(z+h, \zeta) - g(z, \zeta)) d\zeta$$

$$\stackrel{?}{\rightarrow} \int_{\gamma} \frac{\partial g}{\partial z}(z, \zeta) d\zeta, \text{ as } h \rightarrow 0$$

certainly need: $g(z, \zeta)$ complex differentiable in z

then, following suffices: the difference quotients converge uniformly (wrt $\zeta \in \gamma(I)$) to $\frac{\partial g}{\partial z}(z, \zeta)$:

$$\boxed{\forall \varepsilon > 0 \exists \delta > 0 \text{ s.t.} \\ |h| < \delta \Rightarrow \left| \frac{g(z+h, \zeta) - g(z, \zeta)}{h} - \frac{\partial g}{\partial z}(z, \zeta) \right| < \varepsilon}$$

If box holds, then

$$|h| < \delta \Rightarrow \left| \frac{G(z+h) - G(z)}{h} - \int_{\gamma} \frac{\partial g}{\partial z}(z, \zeta) d\zeta \right| \leq \int_{\gamma} \left| \frac{g(z+h, \zeta) - g(z, \zeta)}{h} - \frac{\partial g}{\partial z}(z, \zeta) \right| |d\zeta|$$

$< \varepsilon \underbrace{L(\gamma)}_{\text{length}},$

which implies

$$G'(z) = \int_{\gamma} \frac{\partial g}{\partial z}(z, \zeta) d\zeta$$

so, how close is $\frac{g(z+h, \zeta) - g(z, \zeta)}{h}$ to $\frac{\partial g}{\partial z}(z, \zeta)$?

|| FTC

$$\frac{1}{h} \int_{\gamma} \frac{\partial}{\partial w} g(w, \zeta) dw = \frac{1}{h} \int_{\gamma} \frac{\partial}{\partial z} g(z, \zeta) + \left[\frac{\partial g}{\partial w}(w, \zeta) - \frac{\partial g}{\partial z}(z, \zeta) \right] dw$$

$\nearrow z+h$
 $\nwarrow z$

$\nearrow z+h$
 $\nwarrow z$
 $\frac{\partial g}{\partial z}(z, \zeta)$

$$+ \underbrace{\frac{1}{h} \int_{\gamma} \left[\frac{\partial g}{\partial w}(w, \zeta) - \frac{\partial g}{\partial z}(z, \zeta) \right] dw}_{\text{error term}}$$

If $\frac{\partial g}{\partial w}(w, \zeta)$ is continuous on

$\underbrace{D(z, \rho)}_w \times \underbrace{\gamma([a, b])}_\zeta$

then it is uniformly continuous, so

is $1 \cdot 1 < \varepsilon$ uniformly along γ , for $|h| < \delta$?

$$\forall \varepsilon > 0 \exists \delta \text{ s.t. } |h| < \delta \Rightarrow \left| \frac{\partial g}{\partial w}(w, \zeta) - \frac{\partial g}{\partial z}(z, \zeta) \right| < \varepsilon$$

$$\forall w \in D(z, \delta) \Rightarrow |\text{error term}| \leq \frac{|h|}{|h|} \varepsilon$$

In our case

$$g(z, \zeta) = \frac{f(\zeta)}{(\zeta - z)^n}$$

$$\frac{\partial g}{\partial w}(w, \zeta) = \frac{n f(\zeta)}{(\zeta - w)^{n+1}} \text{ is continuous on } \overline{D(z; \rho)} \times \gamma([a, b])$$

as soon as ρ small enough that
 $\overline{D(z; \rho)} \cap \gamma([a, b]) = \emptyset$.

■

Two beautiful consequences of the differentiation theorem:

Lionville's Theorem: Let $f: \mathbb{C} \rightarrow \mathbb{C}$ be entire ($\mathbb{C}$ -diffble $\forall z \in \mathbb{C}$) and bounded.
 Then f is constant!

($\exists M$ s.t. $|f(z)| \leq M$)
 $\forall z \in \mathbb{C}$)

proof: Let $z \in \mathbb{C}$, $R > 0$, $\gamma_R(t) = z + Re^{it}$ $0 \leq t \leq 2\pi$
 so $I(\gamma_R; z) = 1$.

Thus

$$f'(z) = \frac{1}{2\pi i} \int_{\gamma_R} \frac{f(\zeta)}{(\zeta - z)^2} d\zeta$$

$$\Rightarrow |f'(z)| \leq \frac{1}{2\pi} \int |f(\zeta)| |d\zeta| \leq \frac{1}{2\pi} \frac{M}{R^2} 2\pi R = \frac{M}{R}$$

true $\forall R > 0$. Let $R \rightarrow \infty \Rightarrow |f'(z)| = 0$
 $\forall z$

$\Rightarrow f$ constant ■

Fundamental Theorem of Algebra:

Let $p(z) = z^n + a_{n-1}z^{n-1} + \dots + a_1z + a_0$ be a poly of degree n
 (scaled so that coeff of z^n is 1).

Then $p(z)$ factors into a product of linear factors,

$$p(z) = (z - z_1)(z - z_2) \dots (z - z_n), \quad z_i \in \mathbb{C}.$$

Proof:

- it suffices to prove $\exists$ a linear factor when $n \geq 1$, since general case then follows by induction:

I) FTA true when $n=1$

II) If true for $n-1$, and $p_n(z) = (z - z_n)p_{n-1}(z)$
 then true for $p_n(z)$.

- it suffices to prove $\exists$ a root when $n \geq 1$, since if $p_n(z_n) = 0$ then $z - z_n$ is a factor of $p_n(z)$:

$$\frac{p_n(z)}{z - z_n} = q_{n-1}(z) + \frac{R}{z - z_n} \quad \text{from division algorithm.}$$

$$\Rightarrow p_n(z) = q_{n-1}(z)(z - z_n) + R$$

$$\Rightarrow p_n(z_n) = 0 + R \quad \text{in general; if } p_n(z_n) = 0 \text{ then } R = 0.$$

So we prove that (for $n \geq 1$) $p_n(z)$ has a root.

Proof is by contradiction.

If $p(z) = p_n(z)$ does not have a root

then $\frac{1}{p(z)}$ is entire! Now we'll show it's bounded, $\exists M$ s.t. $|\frac{1}{p(z)}| \leq M$

This implies $\frac{1}{p(z)} = \tilde{\text{const}} \quad \forall z.$

$$\bullet \lim_{|z| \rightarrow \infty} \left| \frac{1}{p(z)} \right| = 0.$$

by Liouville, i.e. $p(z) = \text{const} \quad \nRightarrow$

$$\text{pf: } p(z) = z^n \left(1 + \frac{a_{n-1}}{z} + \frac{a_{n-2}}{z^2} + \dots + \frac{a_0}{z^n} \right)$$

$$|p(z)| \geq |z|^n \left(1 - \left| \frac{a_{n-1}}{z} \right| - \left| \frac{a_{n-2}}{z^2} \right| - \dots - \left| \frac{a_0}{z^n} \right| \right)$$

$$\text{Let } A = \max_{0 \leq i \leq n-1} |a_{n-i}|$$

$$\text{Then } |z| \geq \max(1, 2nA) \Rightarrow \left| \frac{a_{n-j}}{z^j} \right| \leq \frac{|a_{n-j}|}{|z|^j} \leq \frac{A}{2nA} = \frac{1}{2n}$$

$$\Rightarrow |p(z)| \geq |z|^n \left(\frac{1}{2} \right)$$

$$\Rightarrow \frac{1}{|p(z)|} \leq \frac{2}{|z|^n} \quad \blacksquare$$

- Letting $R = \max(1, 2nA)$
We see for $|z| \geq R$, $\left| \frac{1}{p(z)} \right| \leq \frac{2}{R^n}$

for $|z| \leq R$, $\left| \frac{1}{p(z)} \right| \leq M_1$ because $\left| \frac{1}{p(z)} \right|$ is continuous on this compact set.

Thus for $M = \max(M_1, \frac{2}{R^n})$

$$\left| \frac{1}{p(z)} \right| \leq M \quad \forall z \in \mathbb{C}.$$

~~$\nRightarrow$~~ , see above!

Another consequence:

(5)

Morera's Theorem : Let $f: A \rightarrow \mathbb{C}$ continuous
and satisfy rectangle condition

$$\oint_{\partial R} f(z) dz = 0 \quad \forall R \subset A \text{ rectangle.}$$

then $f(z)$ is analytic.

proof : These hypotheses guarantee $f(z)$ has a
local complex antiderivative $F(z)$; $F'(z) = f(z)$
(see §2.3 notes, sept 23)

But by the Cauchy derivative formulas, $F(z)$
is infinitely complex differentiable.
In particular, $F''(z) = f'(z)$ exists!
