Math 1220-3

Notes of 1/16/18

Reminders and Announcements

• You should have received an email from me with login info for WeBWorK.

• If not email pa@math.utah.edu

• Our home page is

  www.math.utah.edu/~pa/1220

• In particular you can find our class notes there, unannotated before class, and annotated (and marked with an asterisk) after class.

• Also a link to our most recent syllabus, and a link to the WeBWorK login.

• You should be done with hw 1. hw 2 is now open.
• Undergraduate Colloquium. Wednesdays, 12:55-1:45, LCB 225

• This week: Peter Alfeld will present Cool Mathematics!

Abstract: I will in fact talk about some unsolved, or recently solved, problems in Mathematics. The main purpose of the meeting, however, will be to organize the Undergraduate Colloquium for those interested in taking it for credit (1 hour credit/no credit). For many participants this will be the first class in which they have to write a technical report. This is a complicated yet gratifying task. I will discuss some of the issues involved and also give a first introduction to the use of \LaTeX.
6.2 Inverse Functions and their Derivatives

- Recall, we defined (in section 6.1)

\[
\ln x = \int_1^x \frac{1}{t} \, dt. \tag{1}
\]

- We obtained, as an immediate consequence by the Fundamental Theorem of Calculus:

\[
\frac{d}{dx} \ln x = \frac{1}{x}.
\]

- We also established, with our definition, that

\[
\frac{d}{dx} \ln |x| = \frac{1}{x}
\]

\[
\ln 1 = 0
\]

\[
\ln ab = \ln a + \ln b \tag{2}
\]

\[
\ln \frac{a}{b} = \ln a - \ln b
\]

\[
\ln x^r = r \ln x
\]

- You might say that this is nothing new, you are already familiar with the natural logarithm. However, what is in fact new is our definition (1). The properties in (2) help establish that our new definition is consistent with our old definition.

- What is that old definition (from College Algebra)? The natural exponential is that exponential that is obtained by compounding 100
percent interest continuously and the natural logarithm is the inverse of that exponential.

- That’s highly unsatisfactory! What does mathematics have to do with paying interest on an investment?

Aside: In WeBWorK \(\ln x\) and \(\log x\) mean the same thing, i.e., the natural logarithm.

- You can convert from the natural logarithm to any other base \(b\) \((b > 0, b \neq 1)\), including \(b = 10\), by the formula

\[
\log_b x = \frac{\ln x}{\ln b}.
\]

- Before loosing sight of the forest for all the trees, today’s main new insight will be that

\[
\frac{d}{dx} e^x = e^x.
\]

- The exponential equals its own derivative.

- How do we get there?

- The starting point is that the exponential is the inverse of the logarithm.
Inverse Functions

- What’s an inverse function?
- The inverse of a function \( f \), if it exists, is denoted by \( f^{-1} \) (pronounced \( f \)-inverse) and is defined by

\[
f^{-1}(f(x)) = x \quad \text{and} \quad f(f^{-1}(y)) = y
\]

for all \( x \) in the domain of \( f \) and all \( y \) in the domain of \( f^{-1} \).

\[
\begin{align*}
x^{-1} &= \frac{1}{x} \\
f(x) &= x \\
\implies f^{-1}(x) &= x
\end{align*}
\]

\[\text{∃ This notation is used everywhere on earth. Nonetheless, it is awful! Note that in general}\]

\[f^{-1}(x) \neq \frac{1}{f(x)}.
\]

- The superscript \(-1\) may denote the inverse or the reciprocal. Which it is depends on the context!
- Life is like that!
Example

$$f(x) = 2x + 6$$

$$\begin{align*}
\gamma &= 2x + 6 \quad\mid\-6 \\
\gamma - 6 &= 2x \quad\mid\-2 \\
\frac{\gamma - 6}{2} &= x \quad\mid\leftrightarrow \\
x &= \frac{\gamma - 6}{2} \quad\mid\leftrightarrow \gamma \\
\gamma &= \frac{x}{2} - 3 \\
\left(f^{-1}\right)(x) &= \frac{x}{2} - 3
\end{align*}$$

Check: $$f^{-1}(f(x)) = \left(f^{-1}\right)(2x + 6)$$

$$= \frac{2x + 6}{2} - 3$$

$$= x + 3 - 3$$

$$= x$$
Example 3:

\[ f(x) = \frac{x}{1-x}. \]

\[
\begin{align*}
  y &= \frac{x}{1-x} \\
  y(1-x) &= x & \text{\textit{\textcolor{blue}{Distribute}}} \\
  y - xy &= x & + xy \\
  y &= x + xy \\
  y &= x(1+y) & \text{\textit{\textcolor{blue}{\div (1+y) \Leftrightarrow}}} \\
  x &= \frac{y}{1+y} & x \Leftrightarrow y \\
  f^{-1}(x) &= \frac{x}{1+x} \\
  f\left(f^{-1}(x)\right) &= \frac{x}{1 - \frac{x}{1+x}} & \text{\textit{\textcolor{blue}{\div \frac{1+x}{1+x}}}} \\
  &= \frac{x}{1+x - x} \\
  &= \frac{x}{1} = x
\end{align*}
\]
• We find the inverse of a function \( f \) by solving the equation \( y = f(x) \) for \( x \) and then interchanging \( x \) and \( y \).

A function may not have an inverse!

• Examples:

\[
y = x^2
\]

\[
y = \sin x
\]
• Clearly, the graphs of a function and its inverse must be related.

Solving $y = f(x)$ for $x$ does not change the graph.

However, switching $x$ and $y$ reflects the graph in the line $y = x$. 
Figure 1. Reflecting in $y = x$. 

Math 1220-3 Notes of 1/16/18
Figure 2. Graphs of $f(x) = 2x + 6$ and its inverse.
The graphs for our first two examples are shown in Figures 2 and 3.

When does a function have an inverse?

Function: Vertical Line Test

Inverse: Apply VLT to inverse, or apply horizontal line test to function.

In particular a function has an inverse if it is
monotonic.

• This means it’s either everywhere increasing, or everywhere decreasing.

• This is true in particular if $f'$ is everywhere positive (increasing), or $f'$ is everywhere negative (decreasing).

In particular, the natural logarithm is monotonic and has an inverse!

$$\frac{d}{dx} \ln x - \frac{1}{x} > 0 \quad (x > 0).$$
Figure 4. Natural Logarithm and Exponential.
Figure 4 shows the natural logarithm and its inverse.

$$f(x) = \ln x$$

$$f^{-1}(x) = \exp x = \exp(x) \quad (= e^x)$$

$$\exp \ln x = x$$

$$\ln \exp x = x$$
Derivatives of Inverse Functions

• Start with

\[ f^{-1}(f(x)) = x. \]

• Differentiate, using the chain rule:

\[ (f^{-1})'(f(x)) f'(x) = 1. \]

• set \( y = f(x) \) and solve for \( (f^{-1})(y) \):

\[ (f^{-1})(y) = (f^{-1})(f(x)) = \frac{1}{f'(x)} \]

• The derivative of the inverse is the reciprocal of the derivative.

• This can be written very suggestively as

\[ \frac{dx}{dy} = \frac{1}{dy/dx}. \]
Example 4.

\[ f(x) = x^5 + 2x + 1, \quad f(1) = 4, \quad (f^{-1})'(4) = ? \]

\[ y = y \]
\[ x = 1 \]
\[ f'(x) = 5x^4 + 2 \]
\[ f'(1) = 7 \]

\[ (f^{-1})'(4) = \frac{1}{7} \]

\[ (f^{-1})'(f(x)) = \frac{1}{f'(x)} \]
The derivative of the Exponential

• Denote the inverse of the natural logarithm by \( \exp(x) \).

• Start with \( \ln \exp(x) = x \).

• Differentiate:

\[
\frac{d}{dx} \frac{\exp(x)}{\exp(x)} = 1. 
\]

• This gives, at long last, our desired result:

\[
\frac{d}{dx} \exp(x) = \exp(x). 
\]

• The exponential equals its own derivative.

• This makes geometric sense.
Examples

• Write \( \exp(x) = e^x \) (strictly speaking we don’t know yet from our definition of the natural logarithm that it’s inverse equals \( e^x \).)

\[
\frac{d}{dx} e^{x^2} = e^{x^2} 
\]

\[
\int 2x e^{x^2} \, dx = e^{x^2} + C
\]

• Do again \( \frac{d}{dx} x^x = \frac{d}{dx} (e^{(\ln x) x}) \)

\[
= \frac{d}{dx} e^{x \ln x} 
\]

\[
= e^{x \ln x} \frac{d}{dx} (x \ln x) 
\]

\[
= (1 + \ln x) e^{x \ln x} 
\]

\[
= x^x (1 + \ln x)
\]
