

The following questions are typical of what you might expect on the midterm exam. The answer of some questions may be useful to simplify the answer others. A midterm exam might consist of a subset of the problems, *e.g.* $\{(2), (4), (6), (8), (10)\}$.

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 2 & -1 & 3 \\ 1 & -1 & 2 \end{pmatrix}, B = \begin{pmatrix} 1 & 1 & 2 & 2 \\ 1 & 2 & 3 & 1 \\ 1 & 4 & 2 & 2 \\ 1 & -3 & 10 & -6 \end{pmatrix}, c = \begin{pmatrix} 1 \\ 4 \\ 7 \end{pmatrix}, d = \begin{pmatrix} 3 \\ 4 \\ 8 \\ -9 \end{pmatrix}, v = \begin{pmatrix} 1 \\ 2 \\ 3 \\ 4 \end{pmatrix}$$

1. Solve $Ax = c$ using Gauss-Jordan elimination.
2. Find A^{-1} using Gauss-Jordan elimination.
3. Solve $Ax = c$ using the inverse matrix.
4. Find all solutions if any of $Bx = d$.
5. Find all solutions if any of $Bx = v$.
6. Find $\det A$.

$$7. \text{ Find } \det \begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 1 & 2 & 2 & 2 & 2 \\ 1 & 2 & 3 & 3 & 3 \\ 1 & 2 & 3 & 4 & 4 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}.$$

8. Solve $Ax = [0, 5, 0]^T$ using Cramer's rule.
9. Find A^{-1} using cofactors.
10. Let M be an $m \times n$ matrix. Show that if $Mx = w$ has two solutions then it has infinitely many.
11. Show that the inverse of the transpose of a square matrix Q is the transpose of the inverse:

$$(Q^T)^{-1} = (Q^{-1})^T.$$

12. Show that if a 4×3 matrix M is row equivalent to $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix}$ then the system $Mx = k$ either has no solution or has exactly one solution. What conditions on k guarantee that there is a solution at all?
