$$\left(P + \frac{a}{v^2}\right)(v - b) = RT$$

$$Pv = nRT$$

$$\kappa = -\frac{1}{V} \left(\frac{\partial V}{\partial P}\right)_T$$

$$\beta = \frac{1}{V} \left(\frac{\partial V}{\partial T}\right)_P$$

The following two properties are equivalent ways of determining exactness:
 1. Mixed second order partial derivatives are equal e.g.:

$$\frac{\partial^2 v}{\partial P \partial T} = \frac{\partial^2 v}{\partial T \partial P}$$

2. Integral is independent of path

$$\int_{v_1}^{v_2} dV = v_1 - v_2 \quad \oint dV = 0$$

A quantity whose differential is *not* exact is not a thermodynamic property.

$$dV = \left(\frac{\partial V}{\partial T}\right)_P dT + \left(\frac{\partial V}{\partial P}\right)_T dP$$

$$H = U + PV$$

$$\Delta U = Q - W$$

$$dU = d'Q - d'W$$

(Where the primes denote inexact differentials)

$$+PV \downarrow \begin{array}{c} -TS \\ \rightarrow \\ \begin{array}{|c|c|} \hline U & F \\ \hline H & G \\ \hline \end{array} \end{array}$$

$$C = \lim_{\Delta T \rightarrow 0} \frac{Q}{\Delta T} = \frac{d'Q}{dT}$$

$$Q = C(T_2 - T_1) = nc(T_2 - T_1)$$
